

CATEFIX

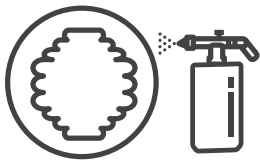

IN FOUR STEPS

GETTING STARTED WITH CATEFIX

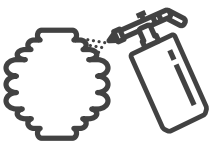

STEP 1

Shake the can well before use. Then pour Catefix directly from the can into your low-pressure sprayer.

STEP 2

Spray a circle around the nest with an overlap of about 5 centimetres and spray Catefix on the outside of the nest until all caterpillars and spins are covered with Catefix.

STEP 3

Then **inject** Catefix well **into the nest**. This is done by holding the end of your sprayer at the top of the nest so that all caterpillars are soaked with Catefix. The caterpillars will then move and get stuck together along with their stinging hairs. Then spray on top of the nest and inject into the nest at the halfway point. During this treatment you will see that Catefix (still in liquid form) seeps through the nest. This is normal as a nest is not watertight. The consumption usage is the same as the contents of the nest. For example: for a 0.5 litre nest you also need 0.5 litres of Catefix.

STEP 4

Wait 1-2 minutes and see if you have actually put all the caterpillars in good contact with Catefix. If this is not the case, treat the nest again. From this point on you don't have to do anything!

Catefix dries within a few hours and forms a solid and hardened shield in and around the nest.
