WitaTrap® Delta Super

Trap especially suited for catching small moths in forestry, vineyards, orchards, gardens and agriculture

- Moths, attracted by a pheromone, stick to glue base and cannot escape.
- When glue base is fully covered with insects, clean it with a spatula and newly coat it with Soveurode Special Glue or simply replace the base.
- Especially suited for small insects like chestnut leaf miner moth, winter moth, larch leaf miner, grapevine moth, cork moth, codling moth, peach twig borer, pea moth, sawfly and many others.
  Suitable pheromones available from Witasek! www.witasek.com

Application/installation:

- Assemble the trap and secure with the wire included depending on the application area. (Precise assembly instructions and the application area can be found with each pheromone trap.)
- To prevent luring the pests straight to the crops being protected, the traps should be placed in a different tree located nearby. If this isn't possible, the trap can be secured to a stake driven into the ground. Hang the trap at eye level between the main wind direction and the tree. The trap entrances must not be blocked by leaves or branches.
- Each trap should be checked regularly at intervals of 2 to 3 days. You should use a tool (e.g. a twig or a spatula) to clean the glue bases of stuck insects as required each time a trap is checked so that the entire sticky surface remains available. If the glue base is severely contaminated, it should be swapped our or made sticky again using Soveurode Special Glue (spray glue).
- Change pheromone plugs and, if necessary, glue bases after 4 to 6 weeks.
- The traps should be hung up before the moths start flying.
- **Storage:** the pheromones should be stored in a cool place (e.g. freezer) in their original packaging until they need to be used.
- **Disposal:** used traps can be disposed of with no problem in the household trash.

(See back for more information on assembly)

item	Product
311411	**WitaTrap® Delta Super – incl. 2 glue bases**
	Shipping unit: 1 pce.
391111	**Glue bases for WitaTrap® Delta Super** – Pack with 2 pcs.
	Shipping unit: 1 pack incl. 2 pcs.

Our WitaTrap Delta Super is also available as a complete set for the following pests

Codling moth
(Cydia pomonella)

Plum fruit moth
(Grapholita funebrana)

Cherry bark moth
(Enarmonia formosana)

cherry fruit fly
(Rhagoletis cerasi)

box tree moth
(Cydalima perspectalis)

chestnut leaf miner moth
(Cameraria ohridella)

European grapevine moth
(Lobesia botrana)

grape berry moth
(Eupoecilia ambiguella)

Corn root worm
(Diabrotica virgifera)

clothes moth
(Tineola bisselliella)

flour moth
(Ephestia kuehniella)

dried fruit moth
(Plodia interpunctella)

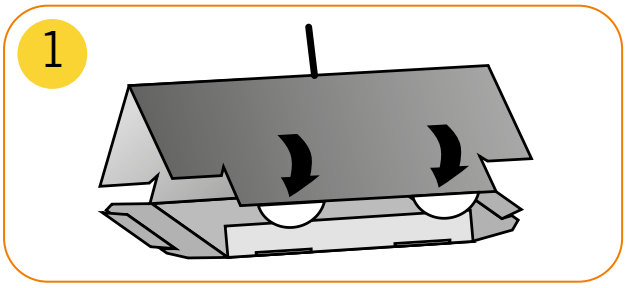
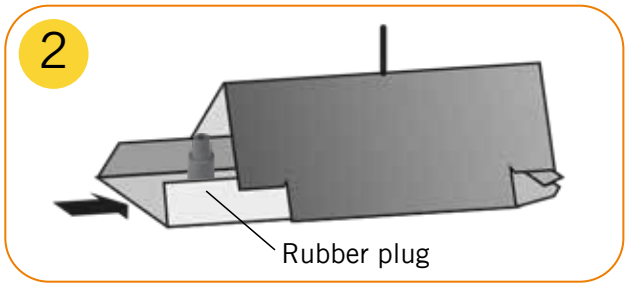
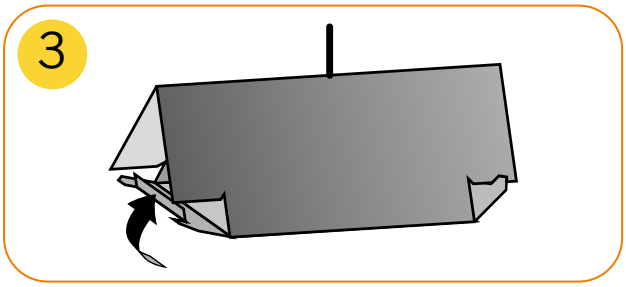
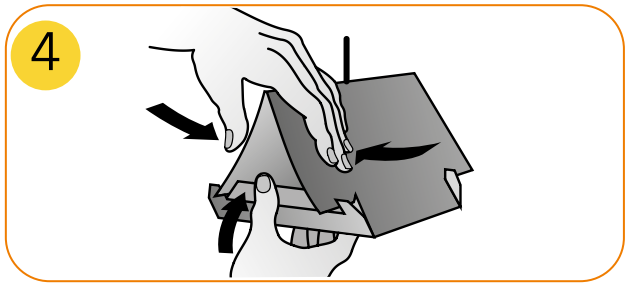
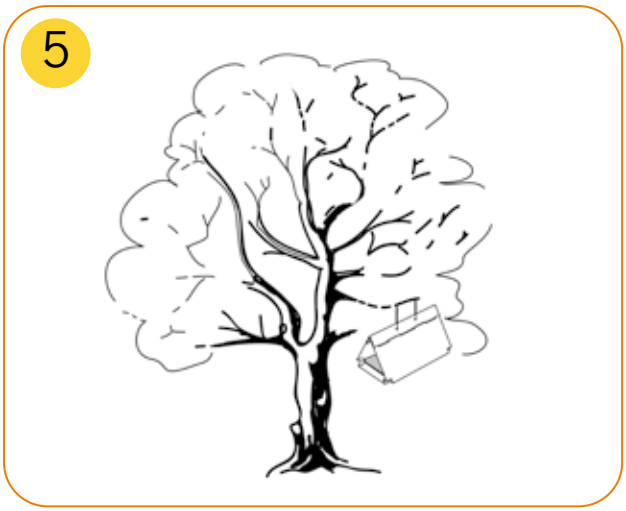
Assembly instructions WitaTrap® Delta Super

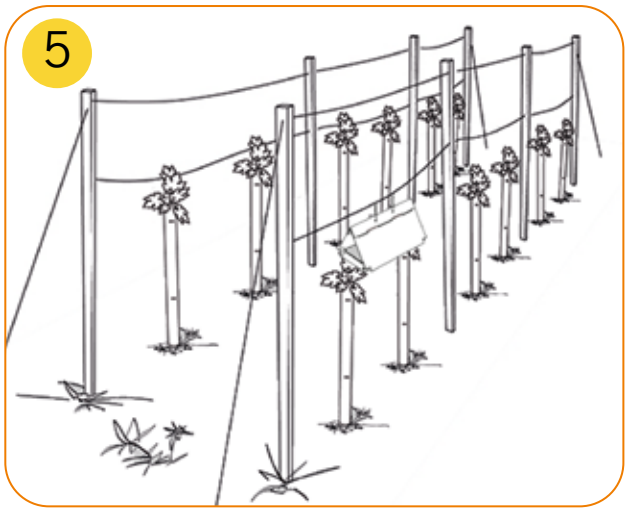












1 Assemble trap and tuck fastening straps laterally into the designated slits.

2 Take out one of the individually wrapped glue bases from the foil and pull off the protective film. Remove suitable pheromone from aluminium bag. Place it in the middle of the glue base and press well down. Due to the sticking effect, it will stay stuck. Slide glue base/attached pheromone (attractant) with glued surface facing upward into the trap. *(The attractant is not included in the scope of delivery and has to be ordered separately.)*

3
4 Fold the flaps laterally upward into the designated slits, so that the glue base cannot fall out.

5 Fix the suspension wire in the upper hole and hang up the finished trap according to the application description. (This depends on which pests you wish to control.)

Hint: *When swapping the glue base, still effective pheromone can be easily reattached to the new glue base*
